

INTERCONNECTS

CLEANER, QUIETER & MORE DYNAMIC

HEAR MORE OF YOUR MUSIC

The Wireworld Series 6 audio interconnect cables described on this page are a rare example of new technology that clearly and objectively advances the art of music reproduction. One of their most obvious advantages is that they sound distinctly cleaner than other cables, especially on vocal sibilance. They also allow quieter details to be heard, while preserving a greater range of dynamic contrasts and musical expression than other cables. Amazingly, they even reduce listening fatigue while improving definition and image focus. No other cables sound as close to the ultimate sonic purity of a direct connection.

Platinum Eclipse and the other Series 6 interconnects utilize Wireworld's new Composilex™ technology, which makes striking improvements in sound quality by virtually eliminating the noise modulation distortion generated by conventional insulation materials. Composilex provides quieter backgrounds, tighter image focus and wider dynamics than would be possible with the insulation materials used in other cables.

Composilex is only part of the specialized DNA Helix™ cable design, which uses a stacked array of four flat conductors to neutralize the electromagnetic loss that filters the signal in other cables. These extraordinary cables are also available in subwoofer, multi-channel and tonearm configurations. The Solstice, Luna and Terra interconnects utilize a simpler version of the DNA design to save cost. The combination of these exclusive technologies, with Wireworld's superior connectors, materials and workmanship, produces the highest fidelity and best value in cables.

DNA Helix™ cable design with Composilex™ Technology (Patent Pending)

The above models are available with balanced XLR terminations
